## A Blue Roof Solution for Sustainable Drainage

With many buildings now having to include SUDS, ICB's blue roof solution can provide the required detention of storm water for discharge over an extended time period.

The EvaBlue supports create a void capable of holding storm water, this is then filtered down through the EvaBlue Outlet at a controlled rate. The flow rate of the EvaBlue Outlet can be adjusted to suit the project specification.

Installed in conjunction with the award winning EvaGreen Green Roof system, ICB (Waterproofing) LTD can supply and install a complete roofing system that includes double layer waterproofing and a Biodiverse / Green Roof system that is both friendly to the environment and aesthetically pleasing.

SUDS systems are now frequently required for large projects by Local Planning Authorities to alleviate the risk construction causes to the natural environment such as downstream flooding, deterioration of river water quality and surface flooding within urban areas.

## A Blue Roof Solution for Sustainable Drainage

This passive SUDS system works in all weather conditions and actively restricts and reduces rainwater run off from the roof using the bespoke EvaBlue Outlet that is custom made for each individual EvaBlue Roof.

Each outlet and inspection chamber is fabricated from powder coated aluminum, with an accessible restrictive plate to control the run off of rain water.

ICB (Waterproofing) LTD can provide the necessary calculations to ascertain the level of restriction required at each outlet, based upon the required water dispersal rate for the project, along with calculating the number of restrictive outlets the project will require.

For more information on our EvaBlue, EvaGreen or Waterproofing systems, please contact us to arrange a CPD.
